

Feature-based twitch fitting: PI-review prototype

Exploratory averaged Mava traces; 6-state model; single-start fits stopped at 30 or 50 evaluations

Interpretation

- Feature objective runs end-to-end; the pointwise pipeline is preserved.
- Acute Mava peak: 30% of Before in Control and 33% in H251N averaged traces.
- Added relaxation freedom improved H251N only within these capped evaluation budgets.
- Control onset requires stimulus-alignment metadata.
- No unique kinetic-driver claim is supported.

Next gate
Normalized cells -> feature variability/covariance
-> frozen alignment -> multistart fits
